Streaming Subscription Customer Policy

A comprehensive synthetic policy document for an agentic AI, customer-support, RAG, CRM, billing, subscription, cancellation, refund, and customer-activity project.

Important notice: This is an original fictional policy created for software development, training, testing, and demonstration. It is not Netflix's official policy and should not be represented as legal advice or as an actual company's terms.

Document version	1.0
Effective date	21 July 2026
Applies to	Synthetic streaming subscription platform
Primary use	Agent, RAG, CRM, billing and support demonstrations
Currency examples	Indian Rupees (INR)

1. Purpose and Scope

This policy defines the rules governing account creation, subscription plans, billing, payment retries, service access, customer activity, cancellation, refunds, account security, support, privacy, and automated agent actions.

The policy is designed so that a customer-support agent or AI agent can use deterministic rules, retrieve policy passages through RAG, explain decisions, and escalate exceptions to a human reviewer.

- Customers must be at least 18 years old or use the service under the supervision of an eligible account owner.
- One account owner is responsible for all profiles, devices, charges, and activity under the account.
- Availability of plans, content, features, prices, taxes, and payment methods may vary by region.

2. Definitions

- **Active:** The subscription is paid and currently entitled to stream.
- **Inactive:** The account exists but has no current streaming entitlement.
- **Past Due:** A renewal payment failed and the account is within a retry or grace period.
- **Paused:** Billing and access are temporarily suspended under an eligible pause arrangement.
- **Canceled:** Auto-renewal has been disabled and the membership has ended or will end at the current paid-period boundary.
- **Refund Requested:** A customer has submitted a request that has not yet been decided.
- **Refund Processed:** The approved refund has been initiated to the original payment method.
- **Activity:** Streaming sessions, titles watched, watch time, downloads, device use, and recent login behavior.
- **Billing Cycle:** Monthly, quarterly, or annual billing interval.
- **Grace Period:** A limited period after payment failure during which retries or restricted access may apply.

3. Account Registration and Eligibility

Customers must provide accurate registration and billing information. Disposable, fraudulent, impersonated, or unlawfully obtained identities may be rejected or suspended.

Email verification or mobile verification may be required before sensitive changes such as password reset, payment-method replacement, refund approval, profile transfer, or account recovery.

- Customers are responsible for maintaining a valid email address and payment method.
- Accounts may not be sold, rented, transferred, or shared outside the permitted household or plan rules.
- Automated sign-ups, credential stuffing, scraping, abusive bots, and attempts to bypass device or location controls are prohibited.
- The platform may request additional verification when risk signals are detected.

4. Subscription Plans and Entitlements

The synthetic platform supports Mobile, Basic, Standard, and Premium plans. The plan controls price, simultaneous screens, quality, download availability, and supported device types.

A plan change normally takes effect immediately for an upgrade and at the next billing date for a downgrade, unless the customer is shown a different effective date during confirmation.

Plan	Monthly example	Screens	Quality	Typical devices
Mobile	INR 149	1	480p	Mobile/Tablet
Basic	INR 199	1	720p	TV/Computer/Mobile/Tablet
Standard	INR 499	2	1080p	TV/Computer/Mobile/Tablet
Premium	INR 649	4	4K + HDR	TV/Computer/Mobile/Tablet

These prices are fictional examples for the dataset and may be modified in the project configuration. Taxes, promotional credits, partner bundles, and currency conversion can change the actual charge.

5. Billing, Renewal, and Payment

Subscriptions renew automatically at the end of each billing cycle unless auto-renewal is disabled before the next billing date. Charges are submitted to the customer's selected payment method.

The customer authorizes the platform and its payment processors to store payment tokens and collect recurring charges. Full card or bank credentials should not be stored in the agent dataset.

- A successful payment sets payment status to Paid and extends the entitlement period.
- A failed payment may trigger up to three automated retry attempts over a maximum seven-day grace period.
- During the grace period, access may remain available, become restricted, or be temporarily suspended based on risk and billing history.
- After the retry limit, the account may become Inactive or Canceled for non-payment.
- Customers are responsible for bank fees, insufficient-fund fees, taxes, and charges caused by outdated payment information.
- Billing receipts should show plan, period, amount, tax, discount, payment method type, and transaction reference.

6. Subscription Status Rules

- **Active:** Payment is current; next billing date is populated; streaming entitlement is enabled.
- **Inactive:** No current entitlement; next billing date is blank; historical profile data may remain available.
- **Past Due:** Payment status is Failed or Retry Scheduled; failed-payment count is at least one.

- **Paused:** Auto-renewal is off during the pause; no new regular charge is collected until reactivation.
- **Canceled:** Cancellation date and reason should be recorded; future renewal is disabled.
- A status update must be auditable with timestamp, reason, source, and responsible system or agent.

7. Cancellation Policy

Customers can cancel through account settings or an authorized support channel. Cancellation stops future renewal but normally does not terminate access before the end of the already-paid period.

The agent must clearly state the effective end date, whether access continues, whether any pending payment retry will be stopped, and whether a refund is being requested separately.

- Cancellation confirmation must include the account identifier, plan, cancellation date, service end date, and reactivation instructions.
- The agent must not claim a refund is guaranteed merely because a cancellation is completed.
- For suspected fraud or compromised credentials, the account may be suspended immediately while identity is verified.
- A cancellation may be reversed before the service end date when the account owner successfully authenticates.

8. Refund Policy

Subscription fees are generally non-refundable after a billing period begins because access is made available immediately. Refunds are exceptions evaluated under the rules below.

Approved refunds are returned to the original payment method whenever technically possible. Banks and payment providers may require additional processing time after the platform marks a refund as processed.

Scenario	Normal decision	Evidence required
Duplicate charge	Eligible	Matching transaction IDs or duplicate billing records
Unauthorized payment	Review / eligible	Identity verification and fraud review
Billing system error	Eligible	Incorrect plan, amount, tax, or renewal record
Extended service outage	Partial or full review	Verified outage and affected period
Accidental renewal	Discretionary review	Prompt request and minimal post-renewal usage
Dissatisfaction with content	Normally not eligible	No platform error
Cancellation after substantial usage	Normally not eligible	Usage and billing records

Refund workflow: Requested -> Under Review -> Approved or Rejected -> Processed. The dataset uses Requested, Approved, Processed, Rejected, or None. A refund amount must never exceed the related captured payment unless a human finance reviewer authorizes an exception.

9. Activity and Engagement Data

The platform may record activity needed to provide, secure, personalize, and improve the service. Activity fields can include last active date, active days, sessions, watch hours, session length, titles watched, completion rate, device type, profiles, and downloads.

Activity level in the synthetic dataset is categorized as High, Medium, Low, or Inactive. This category is an analytical signal and must not be treated as a legal determination or used as the sole basis for denying service or a refund.

- High activity generally means recent use and frequent sessions.
- Medium activity indicates regular but not intensive use.
- Low activity indicates limited recent engagement.
- Inactive generally means no activity during the recent measurement window.
- Customer-facing responses should avoid exposing sensitive internal scores unless the product explicitly permits it.
- Churn-risk scores are estimates and should guide outreach, not automatic punitive action.

10. Household, Profiles, and Devices

The account owner controls profiles and registered devices. Simultaneous streaming is limited by plan. A device may be logged out, blocked, or challenged when unusual location, automation, credential sharing, or security risk is detected.

- Profile names, preferences, maturity settings, watch history, and downloads belong to the account context.
- Customers should remove old devices and change passwords after suspected compromise.
- Downloaded content may expire, require periodic online verification, or become unavailable when licensing changes.
- The service may limit excessive device changes or repeated verification requests to prevent abuse.

11. Content Availability and Service Changes

Titles, audio tracks, subtitles, resolution, and downloads vary by country, device, plan, licensing rights, and technical capability. A title may be added, removed, edited, delayed, or geographically restricted.

The platform does not guarantee that a specific title will remain available for the full subscription period. Material service changes should be communicated when required by applicable law or customer contract.

12. Customer Support and Ticket Handling

Support requests may be handled through chat, email, phone, in-app help, or an AI agent. Each ticket should include category, issue summary, authentication result, actions taken, policy source, outcome, escalation status, and timestamps.

- Agents must verify identity before account recovery, payment changes, detailed billing disclosure, or refund processing.
- Agents may explain policy, collect evidence, create tickets, check status, and perform low-risk actions within authorization.
- Agents must not request full card numbers, PINs, one-time passwords, passwords, or unnecessary identity documents.
- Abusive, threatening, discriminatory, or fraudulent interactions may be ended or escalated.
- Critical security incidents and high-value billing anomalies require human escalation.

13. AI Agent Authorization Rules

An automated agent must operate with least privilege and produce an audit trail. It may take only those actions explicitly enabled by the application and supported by current account data.

Action	Automated permission	Human approval required when
Explain plan/status/policy	Allowed	Policy conflict or legal complaint
Create CRM ticket	Allowed	Never required for basic creation
Check warranty/eligibility-style rule	Allowed	Source data is missing or contradictory
Cancel auto-renewal	Allowed after authentication	Account ownership is uncertain
Issue small standard refund	Conditionally allowed	Amount exceeds configured threshold
Change payment method	Not directly	Secure customer-operated payment flow required
Restore compromised account	Restricted	Security team review required
Delete account/data	Restricted	Identity, retention and legal checks required

14. Escalation Rules

- Escalate suspected account takeover, payment fraud, unauthorized access, or identity mismatch.
- Escalate refunds above the configured automation threshold or involving multiple billing periods.
- Escalate legal notices, regulatory complaints, threats of litigation, law-enforcement requests, and data-rights disputes.
- Escalate repeated payment failures with inconsistent processor responses.
- Escalate vulnerable-customer concerns, accessibility failures, or safety-related content reports.
- Escalate when policy sources conflict, required data is absent, or confidence is insufficient.
- The agent should summarize evidence and avoid making a final claim outside its authority.

15. Privacy and Data Protection

Only data necessary for service delivery, security, billing, support, analytics, and lawful business purposes should be collected. Access must be role-based and logged.

Synthetic project data must not contain real passwords, full payment credentials, government identity numbers, or real customer contact details.

- Personal information should be encrypted in transit and at rest.
- Retention periods should be defined for billing records, support logs, activity history, fraud signals, and deleted accounts.
- Customers may request access, correction, portability, restriction, objection, or deletion where applicable.
- Some records may be retained for tax, fraud prevention, dispute resolution, and legal compliance.
- Marketing consent must be stored separately from service communications.
- Analytics datasets should use masking, pseudonymization, aggregation, or de-identification when practical.

16. Security Responsibilities

- Customers must use strong, unique passwords and protect verification codes.
- The platform may apply multi-factor authentication, rate limits, device checks, IP-risk scoring, and anomaly detection.
- Credential sharing with unknown third parties, phishing, malware, reverse engineering, and unauthorized automation are prohibited.

- Security events should record source, time, affected account, evidence, containment action, and resolution.
- Support agents must never reveal internal security thresholds or fraud-detection logic.

17. Notifications and Communications

Transactional messages may be sent for sign-up, verification, billing, payment failure, cancellation, refund, password reset, security alerts, plan changes, and material policy updates.

Marketing messages require the appropriate consent and must provide a clear opt-out mechanism. Opting out of marketing does not stop necessary service or security communications.

18. Prohibited Conduct

- Using the service for unlawful activity or infringement.
- Circumventing regional, technical, device, household, billing, or security controls.
- Copying, redistributing, rebroadcasting, recording, or commercially exploiting protected content.
- Harassing support personnel or other users.
- Using bots to create accounts, test stolen credentials, scrape content, or overload the platform.
- Submitting false refund claims or chargeback fraud.
- Attempting to access another customer's account or personal information.

19. Suspension and Termination

The platform may restrict, suspend, or terminate access for non-payment, fraud, security risk, prohibited conduct, legal requirement, or material breach. Where appropriate, the customer should receive notice and an opportunity to resolve the issue.

Immediate action may be taken when delay could cause financial loss, security harm, abuse, or legal exposure.

20. Disputes and Chargebacks

Customers should contact support before initiating a chargeback so billing errors can be investigated. A chargeback may temporarily restrict the related account while the transaction is reviewed.

The platform should retain invoice, consent, payment, access, device, communication, refund, and usage evidence needed to respond to a dispute.

21. Data Quality Rules for the CSV Dataset

- customer_id must be unique and non-empty.
- Active or Past Due records should normally have a next billing date.
- Canceled records should have a cancellation date and cancellation reason.
- Refund Status other than None should have a request date and refund reason.
- Processed refunds should have a processed date and positive refund amount.
- sessions_last_30 equal to zero should produce zero average session minutes.
- days_since_last_active should match the difference between the generation date and last_active_date.
- No synthetic record should be interpreted as a real customer.

22. Recommended Agent Decision Flow

1. Identify the customer's intent.
2. Authenticate the account owner at the required level.
3. Retrieve account, subscription, payment, refund, and activity facts.
4. Retrieve the relevant policy section.
5. Check consistency and eligibility rules.
6. Explain the decision in plain language.
7. Request human approval for restricted or exceptional actions.
8. Execute the permitted action.
9. Record an audit log and create or update the CRM ticket.
10. Confirm the outcome and next steps to the customer.

23. Example Customer-Facing Responses

Cancellation: Your auto-renewal has been turned off. You can continue watching until the end of your current paid period. No further regular renewal charge is scheduled.

Past due: Your latest renewal payment was unsuccessful. We will retry the payment during the grace period. Please update your payment method through the secure billing page.

Refund review: Your refund request has been recorded and is under review. Approval is not guaranteed. You will receive an update after the billing evidence is checked.

Inactive account: Your account is currently inactive and does not have streaming access. You can reactivate it by selecting a plan and completing payment.

24. Disclaimer and Project Use

This document and the accompanying CSV are synthetic assets. They are suitable for demos, data engineering, dashboards, churn modeling, SQL practice, RAG, vector search, customer-support agents, workflow orchestration, and testing.

Before production use, replace the fictional rules with legal-approved terms, jurisdiction-specific privacy notices, payment processor requirements, tax rules, accessibility standards, security controls, and actual product behavior.
